```
peptidylprolyl isomerase (EC 5.2.1.8) ROF1 - Arabidopsis thaliana
NyAlternate names: FR565-binding protein; immunophilin; rotamase
Cispecies: Arabidopsis thaliana (mouse-ar cress)
Cispecies: Arabidopsis thaliana (mouse-ar cress)
Cispecies: 72448; S72484
Rivucich, V.A.; Gasser, C.S.
Mol. Gen. Genet. 252, 510-517, 1996
A;Title: Novel structure of a high molecular weight FK506 binding protein from Arabi A;Reference number: S72484; MUID:97071666; PMID:8914512
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Allitrons: 62/1; 91/1; 178/1; 203/1; 230/1; 295/1; 326/1; 384/3; 425/3; 474/3; 517/2 C; Superfamily: peptidylprolyl isomerase ROFI; BKBP-type peptidylprolyl isomerase hom C; Keywords: calmodulin binding; cis-trans-isomerase homology cPPII> F; 57-104/Domain: BKBP-type peptidylprolyl isomerase homology cPPII> F; 77-3216/Domain: BKBP-type peptidylprolyl isomerase homology cPPII> F; 290-339/Domain: BKBP-type peptidylprolyl isomerase homology cPPI3> F; 449-447/Domain: tetratricopeptide repeat homology cTTI> F; 449-482/Domain: tetratricopeptide repeat homology cTT2> F; 483-516/Domain: tetratricopeptide repeat homology cTT3> F; 483-516/Region: calmodulin-binding #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         isomeras
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A; Molecule type: DNA

"Structural organization of the genef encoding human and murine
RK506-binding protein (RKBP) 13 and comparison to FKBP1.";

Gene 134:271-275(1993).

-I - FUNCTION: PPISSES accelerate the folding of proteins. May function
as a component of membrane cytoskeletal scaffols.

-I - GATALYTIC ACTIVITY: CIS-TRANS ISOMERIZATION OF PROLINE IMIDIC
PEPPINED BONUS IN OLIGOPEPTIDES.

-I - ENYME REGULATION: INHIBITED PS BOTH FK506 AND RAPAMYCIN.

-I - SUBGULILIA LILETATION: BNDOPLASMIC RETICULUM LUMEN. MEMBRANE

Biophys. Res. Commun. 189;819-823(1992).
-!- FUNCTION: PPIASES ACCELERATE THE FOLDING OF PROTEINS.
-!- CATALYTIC ACTIVITY: CIS-TRANS ISOMERIZATION OF PROLINE IMDIC PERTIDE BONDS IN OLIGOPEPTIDES.
-!- ENZYME REGULATION: INHIBITED BY BOTH FK506 AND RAPAMYCIN.
-!- SUBCELLUIAR LOCATION: ENDOPLASMIC RETICULUM LUMEN. MEMBRANE ASSOCIATED (PROBABLE).
-!- TISSUE SPECIFICITY: T-CELLS AND THYMUS.
-!- SIMILARITY: BELONGS TO THE FKBP-TYPE PPIASE FAMILY.

-!- FUNCTION: PPIASES ACCELERATE THE FOLDING OF PROTEINS.
-!- CATALYTIC ACTIVITY: CIS-TRANS ISOMERIZATION OF PROLINE IMIDIC PERTIDS BONDS IN OLIGOPEPTIDES.
-!- SUBCELLULAR LOCATION: CYCOPIASMIC.
-!- MISCELLANEOUS: FKBP BINDS TO THE IMMUNOSUPPRESSANT DRUG FK506.
-!- SIMILARITY: BELONGS TO THE FKBP-TYPE PPIASE FAMILY.

"FKBP54, a novel FK506-binding protein in avian progesterone receptor complexes and Hela extracts.",
J. Biol. Chem. 268:24270-2473(1993)
-!- FUNCTION: INTERACTS WITH FUNCTIONALLY MATURE HETERO-OLIGOMERIC PROGESTERONE RECEPTOR COMPLEXES ALONG WITH HSP90 AND P23.
-!- CATALYIC ACTIVITY: CIS-TRANS ISOMERIZATION OF PROLINE IMIDIC PEPTIDE BONDS IN OLIGOPEPTIDES.
-!- ENZYME REGULATION: INHIBITED BY FK506 BUT NOT CYCLOSPORIN.
-!- SUBCELLULAR LOCATION: Nuclear and cytoplasmic.
-!- TISSUE SPECIFICITY: WIDELY EXPRESSED, ENRICHED IN TESTIS COMPARED TO OTHER TISSUES.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Kieselbach T., Petersson U., Bystedt M., Schroeder W.P.;
Kieselbach T., Petersson U., Bystedt M., Schroeder W.P.;
Submitted (JAN-2000) to the SWISS-PROT data bank.
-!- FUNCTION: PPIases accelerate the folding of proteins. It catalyzes
the cis-trans isomerization of proline imidic peptide bonds in
    oligopeptides (By similarity).
-!- CATALYTIC ACTIVITY: Peptidylproline (omega=180) = peptidylproline

"Three-dimensional structure of the immunophilin-like domain of
FRBPS) in solution.";
Biochemistry 35:11045-11052(1996).
-!- FUNCTION: Component of unactivated mammalian steroid receptor
complexes that sediment at 8-10 S. May have a rotamase activity.
May play a role in the intracellular trafficking of hetero-
oligomeric forms of steroid hormone receptors.
-!- CATALYTIC ACTIVITY: CIS-TRANS ISOMERIZATION OF PROLINE IMIDIC
PEPTIDE BONDS IN OLIGOPEPTIDES.
